Immun. 59:2382-2388 [1991].
-! FUNCTION: IMPORTANT ROLE IN THE INFECTIOUS PROCESS. MAY CONTRIBUTE TO BEFICIENT LYSIS OF THE TWO-MEMBRANE VACUOLES THAT SURROUND THE BACTERIA AFTER DIRECT CELL-TO-CELL SPREAD.
-! CATALYTIC ACTIVITY: A phosphatidylcholine + H(2) O = 1,2-diacylglycerol + choline phosphate.
-!- COFACTOR: Binds 3 zinc ions (By similarity).
-!- SIMILARITY: BELONGS TO THE BACTERIAL ZINC-METALLOPHOSPHOLIPASES C
STRAIN=EGD / Serovar 1/2a;

-!- FUNCTION: Bacterial hemolysins are exotoxins that attack blood cell membranes and cause cell rupture. Binds to eukaryotic membranes where it hydrolyzes phosphatidylcholine, sphingomyelin and phosphatidylethanolamine. The diacylglycerol produced can activate both the arachidonic acid pathway, leading to modulation of the inflammatory response cascade and thrombosis, and protein kinase C, leading to activation of eukaryotic phospholipases and

-I-CATALYTIC ACTIVITY: A phosphatidylcholine + H(2)0 = 1,2-
diacylglycerol + choline phosphate.

-I-COPACTOR: Blinds 3 zinc and 3 calcium ions.

-I-COPACTOR: Blinds 3 zinc and 3 calcium ions.

-I-DOMAIN: The protein is composed of 2 domains; the N-terminal domain contains the phospholipase c active site (PLC), in a cleft which is also occupied by the 3 zinc ions. The C-terminal domain is a putative phospholipid-recognition domain, which shows structural homology with phospholipid-binding 2-like domains from a range of eukaryotic proteins. The ability to bind membrane phospholipids in a Ca(2+) dependent manner and toxicity is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         MEDITIE=20465460; PubMed=11008117;

-i- FUNCTION: Bacterial hemolysins are exotoxins that attack blood cell membranes and cause cell rupture. Constitutes an essential virulence factor in gas gangrene. Binds to eukaryotic membranes where it hydrolyzes both phosphatidylcholine and sphingomyelin, causing cell rupture. The diacylglycerol produced can activate both the arachidonic acid pathway. Leading to modulation of the inflammatory response cascade and thrombosis, and protein kinase inflammatory response cascade and thrombosis, and protein kinase C, leading to activation of eukaryotic phospholipases and further
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             STRAIN=SWCP,

Claim 6; SEQ ID NO 381; 192pp; French.

of L The present invention relates to the genome sequence of Listeria monocytogenes EGD-e (see ABA03041). The genome sequence and fragments it are useful for selecting probes and primers for detecting genes in monocytogenes and related organisms, and for studying genetic polymorphisms and other genomes. The present sequence is a protein encoded by the genome sequence of the present invention. Proteins

      antibodies, identification of L. monocytogenes and related organisms, and for blosynthesis and biodegradation, especially biosynthesis of Vitamin Sells. The genome sequence and proteins encoded by it are also useful for selecting compounds that regulate gene expression and cell replication and modulate L. monocytogenes-related diseases. In addition, the genome sequence and proteins encoded by it are useful in pharmaceutical and vaccinas compositions for the treatment or prevention of infections by L. monocytogenes and related organisms. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIND at

                                                                                                                                     Peptides, or conjugates, have the amino acid sequence of the epitopes of C. perfringens alpha-toxin (AT) from amino acids 261-300 but lack phospholiphase C and/or sphingomyelin-hydrolysing activity. The peptides induce a protective immune response against AT when admin. to human or animals. (Updated on 25-MAR-2003 to correct PN field.)

Streetcoccus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, Creating a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleotides 8-100 of a sequence not defined in the specification, for amplifying a target composition primer is substantially complementary to the target sequence the first primer is substantially complementary to the complement of the target sequence, and where the parts of the primers having the target sequence. The target sequence complementarity define the termini of the target sequence or substantial complementary to the complement of the target sequence, and where the parts of the primers having substantially complementary to the complement of the target sequence or substantial complementarity define the termini of the target sequence or substantial complementarity define the termini of the target sequence or substantial complementarity define the termini of the target sequence or protein, and determining whether the test compound binds to the protein and a Streptcocccus pneumoniae bacterium, where one or more genes encoding the proteins has been rendered inactive. The proteins, nucleic card and addisected in an encoding the proteins are also useful in developing vaccines, diagnostics and antibiotics. The methods are useful as genenic sequence. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic forma directly from wire an effect on the present sequence (Updated on 23-0CT-2003 to
   streptococcus bacteria, such as pneumonia, sepsis, otitis media or
                                                                                                                                                   The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the

the invention fractates to an interest acts comparisons of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid
encoding a polypeptide whose expression is inhibited by the antiennse
concleic acid; (2) a host cell containing the vector; (3) an isolated
cucleic acid; (4) an antibody capable of specifically binding
cutisense nucleic acid; (4) an antibody capable of specifically binding
cut the polypeptide; (5) producing the polypeptide; (6) inhibited by the
control or the activity of a gene in an operon required for
proliferation or that has an activity against a biological pathway
control or that has an activity against a biological pathway
control or that has an activity against a biological pathway in which a proliferation-required gene or its gene product lies
congounds activity; (1) actual or the biological pathway in which a proliferation-required gene or its gene product lies
correctly a gene required for cellular proliferation of an
corganism acts; (9) manufacturing an antibiotic; (10) profilling a
compound's activity; (11) a culture comprising strains in which the gene
product is overexpressed or underexpressed; (12) determining the extent
confounds; or (13) identifying the target of a compound that inhibits the
confounds; or (13) identifying the target of a compound that inhibits the
confounds activity; (1) a culture conquise for inhibits confection of
confounds; or (13) identifying the target of a compound that inhibits the
confounds activity; or conference or collection of
confounds or corresponsed or underexpressed; (12) determining the extent
confounds or collection of an organism. The antisense nucleic acids required
confounds or screening for homologous nucleic acids required
confounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format directly from WIPO at
                                                                                     Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Zyskind JW;
Xu HH;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   relates to an isolated nucleic acid comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ohlsen KL,
Forsyth RA,
                                         Protein encoded by Prokaryotic essential gene #31273
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Haselbeck R,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used genes. (I) is useful in gene therapy techniques to rescore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of altes expressing (II). (I) are useful for treating disorders

involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic mains acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed appecification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             57
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          58 AIDIMSRNTTIVNPNE---TALLNEWRADLENGIYSADYENPYYDNSTYASHFYDPDTGT

                                        The present invention describes isolated nucleic acid sequences which encode lipid metabolism related proteins (LMRP). The LMRP nucleic acids encode lipid metabolism related proteins (LMRP). The LMRP nucleic acids man be used to modify lipids and fatty acids, cofactors and enzymes in microorganisms and plants, particularly to produce polyunsaturated fatty acids, and are especially useful in oilseed plants. The nucleic acids may also confer biotic or abiotic stress tolerance, particularly to maize, wheat, rye, oat, triticale, rice, barley, soybeaut, portion, rapeseed, canola, manihot, pepper, sunflower, tagetes, potato, tobacco, eggplant, tomato, vicia species, pea, alfalfa, coffee, cacao, tea, Salix species, oil palm, coconut, perennial grasses and forage crops. AAH50878 to AAH50882 represent primers used in the exemplification of the present invention. AAH5082 represent LMRP protein sequences, and

                                                                                                                                                                                                       The present invention describes 2 Brevibacillus laterosporus insecticidal secreted proteins designated ISP1A and ISP2A. ISP1A, and ISP2A, are insecticidal to Diabrotica virgifiera larvae when ingested by larvae in combination with the ISP2A amino acid sequence 51 to 457, or ISP1A amino acid sequence 51 to 457, or ISP1A amino controlling insects. The polymucleotide sequences encoding ISP1A and ISP2A can be used in the production of transgenic plants resistant to coleopteran insects. The present sequence represents a modified ISP1A-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1. .2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         16-JUN-2003
```

```
The present sequence represents a Brevibacillus laterosporus insecticidal secreted protein designated ISP1A. ISP1A, and ISP2A, are insecticidal to Diabrotica virgifera larvae when ingested by larvae in combination with the ISP2A amino acid sequence 51 to 457, or ISP1A amino acid sequence 51 to 457, or ISP1A amino acid sequence 38 to 811, respectively. ISP1A and ISP2A are useful for controlling insects. The polynucleotide sequences encoding ISP1A and ISP2A can be used in the production of transgenic plants resistant to coleopteran insects
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 63 SRNTTIVNPNETALLINEWRADLENGIYSADYENPY----YDN-STYASHFYDPDT--- 112

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a new insecticidal secreted protein comprising:

(a) amino acid sequence of the smallest active toxin of the protein

(b) the amino acid sequence appearing as ABU08981 (ISB1A);

or (b) the amino acid sequence of the protease-digestion fragment of the

protein encoded by the insecticidal secreted protein (isp) and isp2A);

or (b) the amino acid sequence of the protease-digestion (isp2A);

or (c) the amino acid sequence accession number IMBP 4009. Also

included are a DNA sequence encoding the protein (isp3) and isp2A DNA

comprising the DNA and a plant-expressible promoter region (e.g. the

comprising the bund a plant-expressible promoter region (e.g. the

comprising the chimaeric gene bromoter), a plant cells

comprising the chimaeric gene of integrated in its cells,

a microorganism transformed to contain the DNA encoding ISP1A, or ISP2A, a

controlling insects comprising expressing a plant resistant to

included are a DNA sequence encoding the protein cited above, a chimaeric gene comprising the DNA and a plant-expressible promoter region (e.g. the long and short forms of the corn zrp2 gene promoter), a plant cell.

Comprising the chimaeric gene used to produce the protein cited above, a plant or a seed comprising the chimaeric gene by produce the protein cited above, a microorganism transformed to contain the DNA encoding ISPIA, a process for controlling insects comprising expressing the protein cited above in cells of a plant, a process for rendering a plant resistant to coleopteran insects (comprising transforming plant cells with a first chimaeric gene and a second chimaric gene, and regenerating transformed plants from the cells which are resistant to insects, where the first and second chimaeric gene are ISPIA and ISPIA, and a process for controlling coleopteran insect pests (comprising planting, sowing or growing in a field plants transformed with a first chimaeric gene and a second chimaeric gene, where the first and second chimaeric gene, where the first and second chimaeric gene are ISPIA and ISPIA, and ISPIA, the insecticidal secreted proteins and bNA sequences are useful in making insecticidal compositions or transgenic plants to protect plants (especially crops like corn) from damage caused by insects particularly coleopteran insects (e.g. Diabrostica sp. Diabrostica sp. cand Anthonomus sp.). The proteins are useful for preventing or minimising insectic damage to plants in a field. The present sequence represents ISPIA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         --GTTYIPFAKHAKETGAKYFNLAGQAYQNQDMQQAFFYLGLSLHYLGDVNQPMHAANFT 170

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a new insecticidal secreted protein comprising:

(a) amino acid sequence of the smallest active toxin of the protein comprising a sequence appearing as ABU08981 (ISP1A) or ABU08982 (ISP2A); or (b) the amino acid sequence of the protease-digestion fragment of the protein encoded by the insecticidal secreted protein (isp)1A or isp2A DNA deposited at the BCCM-LMBP under accession number LMBP 4009.                                                                                                                                                                                                           The invention relates to multiprotein complexes from eukaryotes. Proteins of the invention and DNA sequences encoding them are given in records ABR52568-ABR53903 and ACC6610-ACC6144 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent of a plarmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this parent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office. The complete document is available on CD-ROM

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     64;
Sequence 54, Application US/08282197C

Patent No. 5871730

GENERAL INFORMATION:
APPLICANT: Brazinski, Ryszard
APPLICANT: Dery, Claude V
APPLICANT: Beaulieu, Carole
TITLE OF INVENTION: Thermostable Xylanase DNA, Protein and
TITLE OF INVENTION: Methods of Use
NUMBER OF SEQUENCES: 67
CORRESPONDENCE ADDRESS:
ADDRESSERS: Sterne, Kessler, Goldstein & Fox P.L.L.C.
